

1 **ABSTRACT**

2 In a networked client/server system, media content as well as annotations
3 corresponding to the media content can be transmitted from a server(s) to a client.
4 A user interface is presented to the user to facilitate creating new annotations and
5 viewing annotations. According to one embodiment, the client further assists the
6 user in identifying a temporal range of the media content to which the new
7 annotation is to correspond.
